

## ChatFlow Pro – Comprehensive Module-Wise Testing Report

**Application:** ChatFlow Pro

**Testing Type:** Functional, Integration, Workflow, Negative, and UI/Behavioral Testing

**Testing Date:** 24 August 2026

**Platform:** Web Application + WhatsApp-based testing

**Overall Result:** Core functionality working with several behavioral and validation issues identified

---

### 1. Executive Summary

The ChatFlow Pro platform was tested across its major automation, AI, workflow, communication, form, and customer-management modules.

Testing covered:

- Basic Automations
- Custom Auto Reply
- Workflows
- AI Intent Matching
- WhatsApp AI Agent
- Instagram Quickflows
- Voice AI – Inbound Calls
- WhatsApp Forms
- Smart Lists

The testing confirmed that the platform's **core automation and workflow capabilities are functional**. Customer messages can trigger configured automations, multi-step workflows can collect information, WhatsApp forms can capture structured responses, and the AI agent can respond to knowledge-based questions.

However, testing also identified several areas requiring improvement, particularly:

- Overlapping/general trigger handling
- Active workflow interruption
- Greeting/fallback consistency
- Intent matching for synonyms and typos
- Persistence of Working Hours configuration

- Smart List contact creation
- Voice AI dependency on Twilio configuration
- Better conflict resolution between multiple automations

## 2. Overall Module Status

| <div> <div></div> <div></div> <div></div> <div></div> <div></div> </div> <b>Module</b> | Testing Status        | Result                                         |
|----------------------------------------------------------------------------------------|-----------------------|------------------------------------------------|
| Basic Automations                                                                      | Tested                | ● Passed with defect                           |
| Custom Auto Reply                                                                      | Tested                | ● Passed                                       |
| Workflows                                                                              | Tested                | ● Passed with behavioral limitations           |
| AI Intent Matching                                                                     | Tested                | ● Partial / inconsistent                       |
| WhatsApp AI Agent                                                                      | Tested                | ● Core functionality working                   |
| Instagram Quickflows                                                                   | Reviewed / configured | ● Requires further channel-specific validation |
| Voice AI – Inbound Calls                                                               | Configuration tested  | ⚠ Blocked by Twilio/external number dependency |
| WhatsApp Forms                                                                         | Tested                | ● Passed                                       |
| Smart Lists                                                                            | Tested                | ● Defect found                                 |
| Overall Platform                                                                       | Tested                | ● Functional with issues                       |

## 3. Basic Automations

### Objective

To verify that basic automation rules such as greetings, working hours, out-of-office responses, and automated customer responses operate according to their configuration.

### Tests Performed

#### Working Hours

##### Test:

1. Enable Working Hours.

2. Configure Monday as 10:00–10:00.
3. Save Working Hours.
4. Turn Working Hours OFF.
5. Turn Working Hours ON again.
6. Check Monday configuration.

**Expected Result:**

Previously configured Monday timing should remain 10:00–10:00.

**Actual Result:**

Monday timing reset to the default 09:00–18:00.

**Status:**  **Failed**

**Defect**

**Issue:** Working-hour configuration is not persisted after disabling and re-enabling the feature.

**Impact:** High

**Severity:** Medium

**Recommendation:** Persist the configured schedule independently from the enabled/disabled state.

---

**General Automation Testing**

Basic automation behavior was also tested through WhatsApp conversations.

Examples included:

- Greeting messages
- Support messages
- Welcome messages
- Promotional messages
- Working-hours behavior

**Result**

Basic automations generally execute according to their configured triggers.

**Status:** ● **Mostly Working**

---

#### **4. Custom Auto Reply**

##### **Objective**

To verify whether keyword-based automatic replies trigger correctly.

##### **Testing**

A custom keyword-based automation was configured and tested using its trigger keyword.

##### **Result**

The configured keyword successfully triggered the corresponding response.

The Custom Auto Reply mechanism also operated independently from the Working Hours / Out-of-Office configuration.

**Status:** ● **Passed**

##### **Observation**

When multiple automation mechanisms are active simultaneously, overlapping triggers should be tested carefully to ensure that only the intended automation responds.

**Recommendation:** Introduce clear trigger priority rules.

---

#### **5. Workflows**

##### **Objective**

To verify multi-step customer workflows, state management, question collection, and completion behavior.

##### **Workflow Tested**

The Support workflow contained steps such as:

1. Customer selects support type.
2. Customer selects issue.
3. Customer describes issue.
4. Customer provides urgency.
5. Customer provides contact number.

6. System confirms submission.

---

### Successful Test

Example:

**Customer:** Support

**System:** Shows support options

**Customer:** Order issue

**System:** Please describe the issue

**Customer:** Hsm

**System:** How urgent is it?

**Customer:** Low

**System:** Best number to reach you on

**Customer:** 1234567890

**System:** Request successfully logged.

### Result

The complete multi-step workflow successfully collected information.

**Status:**  **Passed**

---

### Workflow State Test

A test was performed where the user sent an unrelated message while a workflow was already active.

### Example

Workflow:

Support → Order issue → Describe issue → Urgency

Then user sends:

hello

### Expected

The system should recognize hello as a greeting/new intent or allow the user to interrupt the current workflow.

### Actual

The system continued the existing workflow and interpreted the message as an answer to the current question.

**Status:** ● **Failed / Behavioral Limitation**

---

### **Active Workflow Interruption**

Another test was:

Support → Order issue → urgency question

Then user sends:

bye

or

done

### **Expected**

- bye → goodbye response / terminate workflow
- done → acknowledge and terminate workflow
- unrelated message → allow new intent or ask whether to cancel

### **Actual**

The system continued asking:

Please reply with one of: Urgent, Normal, Low

### **Defect**

**Issue:** Active workflow cannot be interrupted by unrelated or control messages.

**Severity:** Medium

### **Recommendation:**

Implement global interruption commands:

- cancel
- stop
- bye
- exit
- done

- restart

Also allow high-confidence new intents to interrupt the current workflow.

---

## 6. AI Intent Matching

### Objective

To determine whether customer messages are correctly classified into configured intents.

Example configured intent:

### Order Status

Possible phrases:

- where is my order
  - order status
  - tracking
  - where is my order
- 

### Test

Message:

do you have this in size 9?

### Result

The message did not match the configured Order Status intent.

System showed:

No

Match

Confidence:

0%

Falls through to AI agent

### Expected

The system should either:

- identify the message as a product/size availability intent, or
- correctly route it to the AI agent.

### Observation

The problem is not necessarily a defect in Order Status itself; the message is semantically unrelated to order tracking.

**Recommendation:** Create separate intents such as:

- Product Availability
  - Size Availability
  - Order Tracking
  - Return/Refund
  - Cancellation
  - Payment
- 

### **General Message Testing**

Messages tested included:

- Hi
- Hello
- Welcome
- Working hours
- Bye
- Support
- Helpful
- Technical issue
- Technical problem

### **Result**

Some messages triggered the expected workflow while others were inconsistently handled.

For example:

Support

correctly triggered the support workflow.

However:

Hi

Welcome

Working

hours

Bye

sometimes received no appropriate workflow response.

### **Defect**

**Issue:** General/fallback conversational intent handling is inconsistent.

**Severity:** Medium

### **Recommendation:**

Add dedicated intents for:

- Greeting
- Goodbye
- Business Hours
- Thank You
- Help
- Human Agent
- Cancel
- Restart

---

## **7. WhatsApp AI Agent**

### **Objective**

To test whether the AI agent responds using its configured persona, knowledge base, and available context.

The agent was configured as:

Order Support Agent

with instructions to answer using provided knowledge and campaign context.

---

### **Test Results**

#### **Business Hours**

The AI agent correctly recognized that specific business-hour information was not available in its knowledge base and did not invent an answer.

### **Order Tracking**

When asked:

Where is my order?

the AI agent stated that it did not have sufficient information about the specific order.

This is **correct behavior** because the agent should not fabricate tracking information.

### **Size Availability**

When asked:

Do you have this in size 9?

the agent stated that it did not have enough information.

Again, this is preferable to hallucinating inventory information.

### **Greeting**

hello received an appropriate greeting.

hi was not always handled consistently.

### **Result**

**Status:**  **Core AI Agent functionality working**

### **Limitation**

The agent requires a properly populated knowledge base and/or backend integrations to answer dynamic questions such as:

- Where is my order?
- Is size 9 available?
- What is my return status?
- Can I cancel my order?
- What is my order ETA?

---

## **8. Instagram Quickflows**

Instagram Quickflows — Status:  Pending

---

## 9. Voice AI – Inbound Calls

### Objective

To verify the AI receptionist functionality for incoming calls.

The module provides:

- AI receptionist
- 24/7 call answering
- Automatic caller contact creation
- Human transfer
- Call transcripts

The configuration screen requires:

- Agent name
- Inbound number
- Human handoff number
- Greeting
- Agent instructions

---

### Testing Result

The Voice AI configuration was successfully accessed and saved.

However, live call testing could not be completed because the system requires a **Twilio inbound phone number and webhook configuration**.

The application itself displayed instructions to configure the inbound number and connect the Twilio webhook.

### Result

**Status:**  **Blocked / Pending External Dependency**

### Important

This should **not be reported as a software defect**.

The limitation is caused by the absence of a configured Twilio number/account setup required for actual inbound-call testing.

### Recommendation

For full validation:

1. Obtain/configure a Twilio number.
  2. Configure the inbound webhook.
  3. Configure the status callback.
  4. Call the Twilio number.
  5. Verify AI greeting.
  6. Verify conversation.
  7. Verify human transfer.
  8. Verify caller contact creation.
  9. Verify call transcript.
- 

## **10. WhatsApp Forms**

### **Objective**

To test structured customer data collection through WhatsApp.

A **Customer Support** form was configured with:

- Start keyword: SUPPORT
  - 4 questions
  - Required fields
  - Multiple question types
  - Completion message
- 

### **Testing**

The form was triggered using:

SUPPORT

The system then collected information sequentially.

Example submission:

| Field             | Result            |
|-------------------|-------------------|
| Support category  | Technical problem |
| Issue description | Happy             |
| Urgency           | Urgent            |
| Contact number    | 1234567890        |
| Submission status | COMPLETE          |

Multiple submissions were successfully recorded.

The submission dashboard showed **6 submissions** during the latest testing.

### Result

 **Passed**

### Additional Observation

The form correctly maintains the question-by-question flow.

The final submission is stored and displayed in the submissions table.

---

## 11. Smart Lists

### Objective

To verify customer segmentation and manual contact management.

A segment was successfully created:

### Test Customers

Description:

Test segment for customer targeting

The segment initially contained:

0 Contacts

The **Add Customer** interface was then tested.

---

### Defect Found

Input:

**Name:**

Test

User

**Phone:** 9689607480

When clicking **Add**, the application returned a Prisma error:

Invalid prisma.contact.create() invocation

with the important part:

Argument 'phoneNumber' is missing.

### **Expected**

The entered phone number should be accepted and a new contact should be created.

### **Actual**

The frontend displayed the phone number, but the backend Prisma request did not receive the expected phoneNumber field.

### **Status**

 **Failed**

### **Severity**

**High**

### **Likely Technical Cause**

This appears to be a frontend/backend field-name mismatch or request-body mapping problem.

For example, the frontend may be sending:

phone

while the Prisma model/API expects:

phoneNumber

or the backend controller may not be mapping the submitted phone field correctly.

### **Recommended Investigation**

Check:

1. Smart List Add Customer form.
2. API request payload.
3. Backend controller.
4. Prisma Contact model.

5. Request body field names.
6. Validation schema.

The frontend and backend should consistently use:

phoneNumber

if that is the Prisma schema field.

---

## 12. Cross-Module / Integration Testing

Several behaviors were observed when multiple automation modules were active simultaneously.

### Issue: Overlapping Automations

Different automation systems can respond to similar/general messages.

For example:

- Basic Automation
- Custom Auto Reply
- Workflow
- AI Intent Matching
- WhatsApp AI Agent

may all potentially process an incoming message.

### Risk

A generic message such as:

Hi

could potentially be processed by multiple systems or fall through inconsistently.

### Recommendation

Implement a clear routing hierarchy, for example:

Incoming Message

↓

Active Workflow?

↓

Global Commands / Interruptions

High-confidence Intent

Custom Auto Reply

Basic Automation

AI Agent

Fallback

This would significantly reduce conflicting responses.

---

### 13. Data Persistence Testing

The Working Hours test revealed a persistence issue.

#### Defect

Configuration:

Monday 10:00–10:00

was saved but reverted to:

09:00–18:00

after disabling and re-enabling the feature.

#### Recommendation

Separate:

schedule configuration

from:

schedule enabled/disabled state

Disabling the feature should disable execution, **not overwrite the saved configuration.**

---

## **14. Negative Testing**

Negative testing was also performed.

Examples included:

- Invalid urgency: Urrget
- Invalid support option: Technical issue
- Unrelated message during workflow
- bye during workflow
- hello during workflow
- General unmatched messages
- Invalid Smart List contact submission

### **Results**

The application generally validates structured workflow answers correctly.

For example:

Urrget

was rejected until the user entered:

Urgent

Similarly:

Technical issue

was rejected until:

Technical problem

was entered.

### **Observation**

Structured validation works, but natural-language flexibility could be improved.

For example:

urgent

urgently

this is urgent

very urgent

could ideally map to:

Urgent

---

## 15. Key Defects Identified

| ID     | Module             | Defect                                                | Severity   | Status                  |
|--------|--------------------|-------------------------------------------------------|------------|-------------------------|
| BUG-01 | Basic Automations  | Working Hours reset after disable/enable              | Medium     | ● Failed                |
| BUG-02 | Workflows          | Active workflow cannot be interrupted                 | Medium     | ● Failed                |
| BUG-03 | AI Intent Matching | General messages inconsistently routed                | Medium     | ● Observed              |
| BUG-04 | AI Intent Matching | Synonyms/typos not consistently recognized            | Low/Medium | ● Observed              |
| BUG-05 | Cross-module       | Overlapping automation triggers can conflict          | Medium     | ● Observed              |
| BUG-06 | Smart Lists        | phoneNumber missing in Prisma create request          | High       | ● Failed                |
| BUG-07 | Welcome Automation | Repeated/new-contact behavior inconsistent            | Medium     | ● Requires verification |
| BUG-08 | Voice AI           | Live testing unavailable without Twilio configuration | —          | ⚠ External dependency   |

---

## 16. Major Positive Findings

The testing also confirmed several important strengths.

### ● Multi-step workflows work

Support workflows successfully collect multiple pieces of customer information.

### ● Form submissions are stored

WhatsApp Forms successfully recorded completed submissions.

### ● Workflow state is maintained

The system remembers which question the customer is currently answering.

● **Validation works**

Invalid options such as Urrget are rejected.

● **AI does not blindly hallucinate**

The WhatsApp AI Agent generally refuses to invent unavailable order/inventory information.

● **Custom Auto Reply works**

Keyword-based responses were successfully triggered.

● **Basic automation works**

Configured automation triggers execute successfully in normal scenarios.

---

## **17. Recommended Priority Fixes**

### **Priority 1 – Smart Lists**

Fix the Prisma contact creation error.

**Why:** Customer creation is a core CRM function and currently fails.

---

### **Priority 2 – Workflow Interruption**

Allow commands such as:

cancel

stop

bye

done

exit

restart

to interrupt an active workflow.

---

### **Priority 3 – Intent Routing**

Improve:

- Greeting detection
  - Goodbye detection
  - Help detection
  - Business-hours detection
  - Human-agent detection
  - Synonym handling
  - Typo tolerance
- 

#### **Priority 4 – Automation Conflict Resolution**

Define which automation gets priority when multiple modules match the same message.

---

#### **Priority 5 – Working Hours Persistence**

Ensure saved schedules remain unchanged when the feature is disabled and re-enabled.

---

#### **Priority 6 – Voice AI**

Configure Twilio and perform actual inbound-call testing.

---

### **18. Final Testing Conclusion**

#### **Overall Assessment**

**ChatFlow Pro is functionally operational, with the core automation and customer-interaction features working successfully.**

The testing demonstrated that the platform can:

- Receive customer messages
- Trigger automations
- Execute multi-step workflows
- Validate customer responses
- Collect customer information
- Store WhatsApp form submissions

- Provide AI-based responses
- Maintain workflow state
- Execute keyword-based responses

However, the testing identified several areas requiring refinement before the platform can be considered fully production-ready.

The most important issues are **Smart List contact creation, workflow interruption, intent/fallback consistency, automation conflict resolution, and Working Hours persistence.**

The Voice AI module could not be fully validated because live calling requires an external Twilio number and webhook configuration; therefore, this should be treated as a **pending integration test rather than a product defect.**

---

## 19. Final QA Status

| Category             | Assessment                                          |
|----------------------|-----------------------------------------------------|
| Core functionality   | ● Working                                           |
| Basic automation     | ● Mostly working                                    |
| Custom Auto Reply    | ● Working                                           |
| Workflows            | ● Working with limitations                          |
| AI Intent Matching   | ● Needs improvement                                 |
| WhatsApp AI Agent    | ● Working                                           |
| WhatsApp Forms       | ● Working                                           |
| Smart Lists          | ● Defect found                                      |
| Voice AI             | ⚠ Pending Twilio                                    |
| Cross-module routing | ● Needs improvement                                 |
| Data persistence     | ● Issue identified                                  |
| Production readiness | ● <b>Needs fixes before full production release</b> |

### Overall conclusion:

The platform has a strong functional foundation and the major customer-engagement workflows are operational. The remaining issues are primarily related

**to edge-case handling, workflow control, routing conflicts, data persistence, and one significant Smart Lists backend integration defect. Fixing these issues would substantially improve reliability and production readiness.**
